Hiring Manager
Arcitecta
15 Little Bakers Lane
Northcote, VIC 3070

Dear Hiring Manager,

RE: Student Internship position

I found your Student Internships on the Arcitecta careers page, and one line felt written for me: you want makers who will step into problems “even when there are many unknowns”. I go looking for those on purpose.

I am a third-year student in a Bachelor of Software Engineering (Honours) at Deakin University, finishing in 2028, with a WAM of 81.33 and 100 in Data Structures and Algorithms. My backend unit chair had a habit of telling me “nah, you can't do this”, which works on me every time. So I made my C# REST API drive a robot I had wired myself. It scored 100/100 and I demonstrated it live at Deakin Open Day, which fits your “regularly demonstrate working software” line.

You also ask for pragmatism over dogma. My robot only behaved on fresh batteries. Rather than guess, I read its own boot and reset logs, which blamed a failing buck converter, not my code. By then I had bought a small pile of batteries that are now all about 90 percent full. On concurrency, I audited a robot dispatch API for race conditions and fixed them with atomic PostgreSQL job claims, so each job is claimed exactly once.

Mediaflux is the kind of software I want to learn from. The National Film and Sound Archive chose it as its central digital asset management system, and Mediaflux Real-Time won a 2025 NAB Show Product of the Year award. You own your entire technology architecture, and I like working across layers too: my robot runs from Arduino firmware up to a C# REST API.

One gap: I have not written Java yet. I work mostly in C#, plus C++ for Arduino firmware and JavaScript for React, and you say you will help, so I will hold you to that. I am on a student visa, so I can work full-time from November to February and two to three days a week during trimester.

My resume is attached. I would love an interview, ideally with the robot in tow. Thanks for reading!

Kind regards,

Manit Khera
