Re: Application — Software Engineering (Embedded / Backend)

Dear Hiring Team,

I am writing to ask to be considered for an internship or part-time software engineering position with Mill Software, having read on your careers page that you regularly take on new staff across your core service disciplines. I am a Software Engineering (Honours) student at Deakin University, based locally in Blackburn South, and I would value the opportunity to begin my career with your team.

What drew me to Mill Software is the depth of the work itself. Spending time across your site, the NetTester suite stands out as something genuinely difficult and genuinely useful — Warrior Probe detecting faults and degradation across a network footprint before customers ever feel them, Defender Probe qualifying triple-play services across fibre, satellite and wireless, and InSite turning site commissioning from a paper-based process into a guided one that measurably reduces failure rates and revisits. That NetTester Web delivers carrier-grade measurement with IPv6 and NAT64 support tells me a great deal about the engineering standard behind it. Building tools that operators trust enough to run their rollouts on is a high bar, and fifteen years of doing it across telecommunications, consumer electronics and defence is not something many firms can claim.

I would be applying to learn rather than to arrive finished. My interest sits exactly where your core competency does — embedded systems and Linux on ARM-based devices, and the backend services that sit above them — and the chance to develop that under engineers who build it professionally would expand my knowledge far beyond what university projects can offer.

By way of background, my coursework has given me a working foundation to build on: C and C++ on microcontrollers with I²C sensor interfacing, a Raspberry Pi service deployed under systemd with MQTT telemetry, and backend development in C# and ASP.NET Core with PostgreSQL. These are student-scale projects, but they reflect where my interest genuinely lies and the standard I hold myself to — I achieved 100 in Backend Development, 100 in Data Structures and Algorithms, and 93 in Embedded Systems, and one project was selected for showcase at Deakin Open Day.

In short, I offer a solid technical grounding, a strong work ethic, and real enthusiasm for the domain Mill Software works in — and I am eager to be taught. I would be grateful for the chance to contribute in whatever capacity is useful to your team. Thank you sincerely for taking the time to consider my application, and I look forward to the possibility of speaking with you at interview.

Yours sincerely,

Manit Khera
